

MicroMain

Facility Management

With MicroMain, you can improve your day-to-day facility management and better plan for the future. Use MicroMain™ Facility Management software to save money and improve space planning, move management, maintenance, and other FM operations.

Easy to learn and simple to use, the software gives you the tools you need to link your facility data to your facility drawings. You determine:

- Level of detail for your drawings
- Color and pattern settings
- Label and legend styles

You can then use the software with your data-enabled drawings to:

- Visualize your facilities
- Easily locate people, areas, and equipment
- Plan for emergencies
- Manage more efficiently
- Create your own reports
- Use the system the way that makes the most sense for you

MicroMain makes its software available “open.” This unprecedented offering gives you complete solution control and flexibility. By having access to the source code, you have the option to use your own staff or third-party programmers to customize core functionality to suit your needs.

Link Drawings to Data

By linking your facility data to your facility drawings, you will be able to see not only your space and square footage, but also your equipment, people, and supporting infrastructure. This visual representation of your facility will help you:

- View your current situation
- Review asset, maintenance, and move histories
- Plan for the future

If your drawings are already digitized, you can use an AutoCAD tool to link drawing objects to your MicroMain database. MicroMain works inside AutoCAD to provide a graphical interface to facility drawings.

Easily Locate People, Areas, Equipment

Using MicroMain Facility Management, you can find any person, area or equipment. It's simple to locate people — occupants, tenants, employees or others — related to your facility. Use the “Find” feature to locate individuals, and the areas they occupy will be highlighted on your drawing.

With MicroMain, you'll be able to access both current and cumulative occupancy data. This will help you:

- View occupants lists and summaries
- Move people to new locations
- See where space is over- or under-populated
- Determine occupancy by department
- Track vacancies or calculate churn rates

Equipment or asset locations can be similarly viewed graphically in drawings—for example, you could search for all of the fire extinguishers in your facility and have them appear in your data-enabled drawing. You can also:

- Track assets by type, location, or department
- View pictures of equipment
- Locate all assets with the same user-defined label
- Track equipment contact information
- View the maintenance history for each asset, equipment, or equipment component

Improve Operations

MicroMain's software is very flexible, so you can use it in the way that makes the most sense for your organization. Many organizations use CAFM software to manage day-to-day activities, including:

- Facilitating moves for staff or residents
- Locating assets for inspections
- Processing maintenance needs
- Using data to respond to FM helpdesk requests
- Printing facility drawings with work orders
- Running reports

The data from the software also gives you the opportunity to plan for better facility optimization over time.
