

MicroMain

Mobile for Pocket PC

MicroMain™ Mobile helps you save valuable time by creating, updating and closing work orders electronically.

Instead of printing work orders, having maintenance technicians travel back and forth to retrieve new papers, and manually inputting all data, you use Pocket PC devices to streamline your workflow. Your technicians can receive and send data electronically—wirelessly, cable syncing, or both—increasing both convenience and accuracy.

Easily Transmit Work Orders

With MicroMain Mobile, your maintenance staff can:

- Download work orders at any time
- Complete tasks
- Update the work order at the point of work performance
- Upload completed work order information

Whether in the field or on the plant floor, technicians complete the work and close out the work orders on their Pocket PCs. Using the wireless option, maintenance staff can upload anywhere within the wireless "cloud" and update the database in real time. With the tethered option, they use a cradle to update the database at the end of a work shift.

This electronic transfer of information increases accuracy and eliminates need to retype information entered on paper work orders.

Improve Productivity

Your staff will be able to get more work done in less time using Pocket PCs for work orders and inspections. They can:

- Download their assigned work orders
- View work orders available to all staff and self-select for completion
- Download new work orders throughout their shift
- View parts and tools needed for the work
- Check off inspection points
- Enter time in and time out
- Enter total hours worked
- Create new work orders on the fly
- Enter detailed comments
- Upload at their convenience

Instead traveling back to the shop to get the paperwork, your technicians can open and close new work orders on the spot, completing any additional work that they see needs to be done. They can also enter inspection data—including pass/fail, ratings, measurements, readings and asset conditions—or mark inspection points for follow-up. The software will automatically track failed inspection points, as well.

Use Barcodes

You can also save time with barcode scanning using MicroMain Mobile. When your technicians scan a barcode on an asset, such as an air conditioner or a drill press, their Pocket PC will display all current work orders for the specific equipment. If no work orders exist, a new work order can be created.

Increase Efficiency

You can increase efficiency by using the software to add parts and labor to work orders. In addition, you have several filtering options for assigning work orders, limiting assets, and limiting parts. Reviewing options include:

- All work orders
- Work orders that do not have labor assigned
- Work orders with assigned labor
- Work orders with assigned shops

Administrators also can set up security for each maintenance technician to determine who has access to the software and which work orders are available to which technicians.
